*Simply no phrases to explain. It is definitely simplistic but shocks from the fifty percent from the pdf.

Excerpt: . . . that the mean of the x -errors will be $\pm \sqrt{k}$ units and the mean of the y -errors $\pm \sqrt{k}$ units. The units of measure dx and Ay can be taken as small as we please, and the exponents in the polynomial will be regarded as whole numbers. In k observations, the most probable total effect, in the x and y directions, of the elementary error $211: 2:$ and $3Ay$ for example, will be $M2. 8(2A)^2 |5|2. 3(3Ay)^1$ and so on for other errors. The most probable algebraic sums of the x and y errors then will be $ml, , , , ml, , , mA, , , , (mimfi, l -(. . . 1; i. ;i-i;i7--) 3)$ so that these are approximately the exponents of E and 17 in that term in the expansion of (2) whose coefficient is a maximum. Hence the most probable error in the mean of the k observations, in the x and y directions respectively, is found by dividing the expressions (3) by k . It will be seen that the quotients thus obtained are the statical moments of the coefficients 1 about the axes of Y and X , these coefficients being regarded as masses in a system of material points. The same quotients also represent the lever arms of the system about those axes, since the sum of all the masses 1 is unity. From the principle established in my article of March 80, p. 46, it follows that the...
