EFFICIENCY Introduction As in the case of other transformations of energy, in the conversion of electrical into mechanical, or vice versa, losses arise which, with dynamos and motors, are of an electrical (magnetic) and mechanical nature. The value of these losses (i.e. the determination of efficiency) is, from the reasons given in Chapter III., of great importance. Though from a commercial point of view the knowledge of the total efficiency is quite sufficient, it is very important for the designer of an electric machine to know how the total losses arising in a machine are comprised. We shall therefore not only deal with the various methods for the determination of efficiency of dynamos and motors, but also the methods of finding and separating the individual losses. The efficiency (η) of a machine is equal to the ratio of the power delivered (P_a) and the power consumed (P_c); thus: Consider the transformation of energy in the case of a generator. A part of the mechanical energy supplied to the generator is lost or rather transformed into heat by the mechanical and magnetic frictions. The remainder of this energy is transformed into electrical energy. But not all of the latter can be employed usefully; part of it is required to excite the machine, and...
