Excerpt: . . . least 3 feet away from the trees. With ordinary precautions where there is plenty of water the use of alfalfa is recommended. Where water is scarce it should never be grown as it requires a large amount of moisture and frequently trees are stunted because of its use as a cover crop under drought conditions. FERTILIZERS. Under the previous heading the fertilizing value of cover crops, especially the legumes, was briefly discussed. The judicious use of such crops where conditions will permit of their growth will result in good tree growth, and the production of big crops of good fruit without the addition of other fertilizers. It must be remembered, however, that nitrogen is the only essential element of plant food that is added to the soil by plants of the family Leguminosa. Indirectly they serve another valuable purpose in that they greatly improve...
